

# Mobile Auditor®

VS

# Manual Audits

Technology has made our lives easier than ever. So why are operations and quality teams still using pen and paper to evaluate or audit locations of global companies? We put together a breakdown of how technology helps you save time in audits, see important information faster, get painless reporting and analytics, and automate corrective actions. It's time to put away the clipboard.

## Mobile Audits

Cloud-based mobile software helps you implement easy auditing and inspection. You can also do more than electronically gather data. Some solutions offer business intelligence and automated corrective action.

## Manual Audits

Data gathering is cumbersome and time consuming with manual audits. Data entry then eats up more time, and reporting is frustrating. Corrective action is inconsistent and can take weeks to be implemented.

## The Audit

Audit on any device, any time, any where, even without a data connection. Historical information is at your fingertips. Upload video, documents, and photos to highlight critical details.

Time is wasted shuffling through a sheaf of papers, or digging for past results. Data integrity relies on auditors accurately entering info, and audits must be redone if a question is missed.

## Results

Instant uploads mean managers or other contacts get their results on the site or immediately after. It's clear if they passed or not, and what they are doing right or items need to be improved.

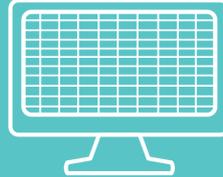

Managers don't get results until days or weeks later, which can lead to crucial fixes being missed or their memory of issues being unclear with time.

## Data

When you work in the cloud, everyone is using the most up-to-date forms and audits, and the results are all instantly compiled into a single data warehouse.

Inspectors must spend hours after the review manually entering data from paper forms, or organizing and exporting results from forms into spreadsheets.

## Communication

Everyone who needs information gets it. The system can do the legwork for you, automatically generating relevant reports and alerting points of contact you designate to receive information.

People are missed, get multiple emails, or an attachment is too big to get through. In the end, manually emailing information to multiple lists leads to something falling through the cracks.

## Reporting and Analysis

Highlight key data with role-based home pages. Then drill down with reporting dashboards that give you right information on demand to help guide business needs and strategy.

Effective reporting is difficult when pulling information from unconnected spreadsheets, PDFs, or forms. Analyzing data for trends is frustrating and time consuming with a manual process.

## Corrective Action

As soon as the review is uploaded, any out-of-compliance result automatically triggers a workflow that assigns the corrective action and follows up until remediation is complete.

Under a manual system, corrective actions take time you can't afford if there is a health or safety risk. Tasks often aren't assigned for weeks, and follow up and documentation can be spotty.

## The Difference

A worry-free, time-saving solution that gives you up-to-date, on demand information, empowers the company with data needed to make the decisions, and proactively manages quality, brand, and safety.

A fatigue-inducing, time-intensive process that lets problems go undetected until they're full-blown liabilities, and makes it difficult to get a clear picture of quality and operations within an organization.
