# RizePoint **Inspect**

Compliance Management Software

RizePoint Inspect is your total solution software for auditing, reporting, and corrective action. It helps you gather data better so you can see issues earlier and act faster to correct those issues to continually improve your business. When you fully integrate your compliance program management, you'll save time while gaining transparency into the health of your compliance processes.

As a cloud-based, mobile auditing solution, RizePoint Inspect helps auditors save time while increasing compliance and reducing auditor fatigue. Automated feedback reports and corrective action plans help you easily visualize and track quality and brand compliance across hundreds of locations. You'll get a level of visibility like never before, so you can focus on parts of your business that need it most.

Mobile Auditor

Assessors can capture data easily — online or offline — during on-site audits and inspections with RizePoint Inspect's Mobile Auditor. You can attach videos, images, or other files to highlight important evaluation detail. This helps location managers understand issues better and correct them faster. Feedback reports and corrective action plans are generated and sent automatically to stakeholders, freeing auditors from the time-consuming burden of manual report creation.

Audit Form Creation

RizePoint Inspect's Form Builder is a simple, form-creation interface focused on gathering data faster. You'll gain complete control over asking the right questions to ensure all standards and regulations are met. Build customized forms that include several question types, including radio, dropdown, spinner, text, temperature, date, time, and many more. Additionally, you can set question logic based on answers to help you ask the right questions, collect accurate information, and gain visibility to align business practices with business values.

Corrective Action Management

Corrective actions plans are automatically created for any item marked out-of-compliance during an on-site assessment. Set rules to trigger action plan tasks, establish due dates, send notifications, create alerts, issue reminders, and monitor task completion. You can also establish timelines and deadline alerts to ensure completion of any corrective action program. With streamlined follow up plans in place, you'll be able to act quickly in moments of crisis to correct smaller issues before they become big problems.

Feedback Reports

RizePoint Inspect empowers auditors to deliver accurate and consistent leave-behind reports in seconds without losing the importance of location-specific customization. Feedback reports are created automatically with data gathered with Mobile Auditor, saving auditors hours every year and reducing auditor fatigue. You'll gain inspection transparency and insights into the health of your processes, so you can act faster to improve compliance and consistency while reducing risk. With this hub of centralized information for reports and evaluations, you can easily store reports for future reference to improve your processes.

Thermocouple Integrations

If food safety is part of your everyday business, food temperatures are key to keeping your customers safe and protecting your brand. Create an indisputable source of food safety data with Bluetooth tech integrations. RizePoint Inspect works seamlessly with Cooper Atkins Blue2 or Thermoworks BlueTherm to simplify food temperature and line-check audits. Temperatures are synced in real time directly in Mobile Auditor, saving auditors time and virtually eliminating risk of results tampering. Immediate results gives you the power of real-time corrective action to reduce the risk of food borne illness.

Intelligent Analytics

RizePoint Inspect provides one hundred percent transparency and visibility into all of your compliance programs. With configurable dashboards and reports, you can detect areas for improvement and provide visual reporting for location, region, or total business performance. Detailed insights then help you focus your limited resources on managing specific risk levels. Now you can easily identify noncompliance to correct issues quickly.
