

RizePoint Form Builder

RizePoint Form Builder enables high quality performance and ensures a stronger brand experience. The simple form creation interface empowers the novice, while delivering the feature-rich capabilities required by a seasoned veteran. Now users can start thinking strategically, and go beyond the standard audit, by completing more activities faster. Administrators can rapidly assemble diverse question types and assign logic, comments, notifications, and policy to them. Form Builder helps users ask the right questions, collect accurate information, and gain visibility to align business practices with business values.

Form Simplicity

Quickly design, edit, and publish audit questions and responses with RizePoint Form Builder. The simple interface enables administrators to select from a series of question types—radio, dropdown, text, numerical, spinner and more—that help pinpoint specific data faster. Users can group questions into sections for easy form navigation. Evaluators will save time by moving seamlessly through each form section—they'll never have to dig through complex forms again.

Quick Reference

Form Builder users can create predefined comments for additional intelligence surrounding specific audit questions. Administrators can easily set notifications as reminders. In addition, the solution enables the user to insert policy, and even upload documentation and visuals to a form for a quick reference guide.

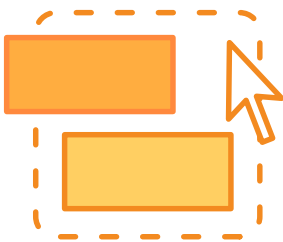

Question Logic

Form Builder enables users to define question logic – triggering an action, or additional exploration for deeper insights. This logic includes conditional statements and their associated follow up questions, fail questions, sections, and forms.

Form Library

Gain visibility and rapid access to forms in the solution library. In this view, administrators can manage the draft and published status, and view when forms were last updated.

Form Versioning

Form Builder users can easily duplicate forms for editing and republishing. Form developers can create, locate, and manage form versions from a single view.
